Advances in Geoscience and Remote Sensing. Remote sensing is the acquisition of information of an object or phenomenon, by the use of either recording or real-time sensing device (s), that is not in physical or intimate contact with the object (such as by way of aircraft, spacecraft, satellite, buoy, or ship). In practice, remote sensing is the stand-off collection through the use of a variety of devices for gathering information on a given...

Remote sensing allows for map revision at a small to medium scale which makes it a bit cheaper and faster. Color composite can be obtained or produced from three separate band images which ensure the details of the area are far much more defined than when only a single band image or aerial photograph is being reproduced.
