Discrete random variables. If the possible outcomes of a random variable can be listed out using a finite (or countably infinite) set of single numbers (for example, $\{0, 1, 2, \dots, 10\}$; or $\{-3, -2.75, 0, 1.5\}$; or $\{10, 20, 30, 40, 50, \dots\}$), then the random variable is discrete. Continuous random variables. If the possible outcomes of a random variable can only be described using an interval of real numbers (for example, all real numbers from zero to ten), then the random variable is ...

In a discrete probability distribution, the sum of the probabilities must equal 1, and all probabilities must be greater than or equal to 0 and less than or equal to 1. Notice that all the given probabilities are greater than or equal to 0 and less than or equal to 1. The probability $P(4)$ is missing from the distribution.

Statistical inference requires assumptions about the probability distribution (i.e., random mechanism, sampling model) that generated the data. For example for a t-test, we assume that a random variable follows a normal distribution. For discrete data key distributions are: Bernoulli, Binomial, Poisson and Multinomial.
