These findings suggest that many perioperative physicians may have become too restrictive if using a zero-balance approach, and that a moderately liberal fluid regimen aiming for an overall positive fluid balance of 1 to 2 l at the end of surgery should be recommended 30 —that is, an overall crystalloid fluid infusion rate of 10 to 12 ml · kg⁻¹ · h⁻¹ during major abdominal surgery, and 1.5 ml · kg⁻¹ · h⁻¹ in the 24-h postoperative period. Other types of major surgery not ...

Appropriate fluid management is a cornerstone of anesthetic practice. 1 Unfortunately, there is disagreement as to how to translate that goal into practice. Anesthesiologists know that too much fluid may lead to complications from side effects, including tissue edema, poor cardiac function, or pulmonary compromise.
